Quality Planning: Principles and Practices A new role for Risk Analysis in developing Analytic QC Plans?

> James O. Westgard Westgard QC, Inc. Madison, WI 53717

#### "A rose is a rose is a rose!"

2

# But, is a glucose a glucose a glucose?

## Or, a glucose a BMG glucose or an e-glucose from HbA1c?

Or, an INR an INR an INR?

Harmonization is a major issue for medical laboratories today!
"Improving Clinical Laboratory Testing Through Harmonization: An International Forum", Oct 26-27, 2010, NIST, Gaithersburg MD

The AACC is hosting an invitation only conference on global harmonization of results from clinical laboratory testing procedures for which no reference measurement procedure exists or is likely to be developed. The two-day conference will seek to strengthen quality of laboratory measurements and improve patient care by developing consensus on technical and organizational processes to achieve harmonization of clinical laboratory results.

#### Harmonization

CLSI definition: harmonization in glycohemoglobin (GHB) testing, the process by which GHB test results among laboratories are made comparable to a common reference.

Harmonization is a process!

Comparability is a measure of the outcome!
 Are HbA1c test results comparable today?

# How assure comparability?Traceability

In principle, laboratory methods should have common reference materials and methods to establish the correct or true test values Analytical Quality Management (AQM) Quality systems, method validation, QC design, Analytic QC Plan, Risk Analysis External Quality Assessment In practice, test performance must be monitored to demonstrate comparability

#### What's the plan for AQM?

#### 1999 Stockholm Conference Global Analytical Quality Specifications

"Hierarchy" of quality specifications

- Quality required for specific clinical applications
- Quality required generally to monitor individual subjects based on intra-individual biologic variation
- Quality recommendations from experts and expert groups (e.g., NCEP, NACB, etc)
- EQA or PT quality requirements (e.g, CLIA)
- "State of the Art" requirements

Reference: Strategies to Set Global Analytical Quality Specifications in Laboratory Medicine. Scand J Clin Lab Invest 1999;59:No.7(Nov)

#### "Systems" Perspective

Ref: Westgard JO. The need for a system of quality standards for modern quality management. Scand J Clin Lab Invest 1999;59:481-486.

#### Progress with Quality Goals

FDA supports use of Allowable Total Error to validate quality of "waived" tests Recommends use of "error grids" Clarke et al. Diabetes Care 1987;10:622-8 Parkes et al. Diabetes Care 2000;23:1143-8 CLSI EP27P published late 2009 "How to Contruct and Interpret an Error Grid for Diagnostic Assays"

#### FDA Guidance (2008) Allowable Total Error Grid

Guidance for Industry and FDA Staff: Recommendations for Clinical Laboratory Improvement Amendments of 1988 (CLIA) Waiver Applications for Manufacturers' of Invitro Diagnostic Devices. Jan 30, 2008, Food and Drug Adminstration

#### HbA1c Diagnostic (Δ0.8%Hb) and Monitoring (Δ1.0%Hb) Goals vs NGSP Certification vs CAP PT

**Reference Method Value (%Hb)** 

#### What's the plan for AQM?

# Metrological Standards for Quality Measurement Processes Traceability

Property of the results of a measurement or the value of a standard whereby it can be related to stated references, usually national or international standards, through an *unbroken chain of comparisons* all having stated uncertainties

#### Uncertainty of measurement

 Parameter, associated with the result of a measurement, that characterizes the dispersion of the values that could reasonably be attributed to the measurand

#### **Traceability Chain**

844 Thienpont et al.: Metrological traceability of calibration and common medical decision-making criteria

![](_page_14_Figure_2.jpeg)

#### **Issues with Traceability**

Definition of analyte and units "Physico-chemical complexity" of biologic measurands and matracies Lack of Primary Reference Materials Lack of Primary Reference Methods Lack of Secondary Calibrators Lack of Secondary Reference Methods Need for Reference Laboratory Services

#### "Medical Traceability"

Thienpont et al. Clin Chem Lab Med 2004;42:842-850 "Physio-chemical complexity" Complex biologic matrices Analyte may be a class of substances Lack of specificity in measurement procedures Need for traceability models that utilize "accepted" reference materials and methods, value-assignment protocols, laboratory networks as base of reference

#### Model II: International Reference Method and Calibrator

![](_page_17_Figure_1.jpeg)

**Figure 2** Calibration hierarchy and metrological traceability to an international conventional reference measurement procedure and international conventional calibrator (applies, e.g., to the measurement of the amount-of-substance concentration of hemoglobin (Fe)).

#### What's the plan for AQM?

Method Validation in the Real World: HbA1c example Lenters-Westra E, Slingerland RJ. Six of Eight Hemoglobin A1c Point-of-Care **Instruments Do Not Meet the General Accepted Analytical Performance** Criteria. Clin Chem 2010;56:44-52. Bruns DE, Boyd JC. Few Point-of-Care Hemoglobin A1c Assay Methods Meet Clinical Needs. Clin Chem 2010;56:4-6.

## Precision results from Lenters Study

| Table 1. EP-5 total CV imprecision results from the different POC instruments. |              |                |              |              |              |             |  |  |
|--------------------------------------------------------------------------------|--------------|----------------|--------------|--------------|--------------|-------------|--|--|
|                                                                                | In2it        | DCA<br>Vantage | Clover       | InnovaStar   | Nycocard     | Afinion     |  |  |
| Patient sample 1                                                               | 4.9% (5.1%)ª | 1.8% (5.1%)    | 4.0% (5.0%)  | 3.2% (5.2%)  | 4.8% (4.8%)  | 2.4% (4.7%) |  |  |
| Patient sample 2                                                               | 3.3% (11.2%) | 3.7% (11.2%)   | 3.5% (11.9%) | 3.9% (11.5%) |              |             |  |  |
| Nycocard normal control                                                        |              |                |              |              | 5.3% (6.1%)  |             |  |  |
| Nycocard abnormal control                                                      |              |                |              |              | 5.2% (11.6%) |             |  |  |
| Afinion control CI                                                             |              |                |              |              |              | 1.4% (6.3%) |  |  |
| Afinion control CII                                                            |              |                |              |              |              | 1.8% (8.2%) |  |  |

 $^{\rm a}$  Hb  $A_{\rm 1c}$  value of the sample/control are in parentheses.

Lenters-Westra E, Slingerland RJ. Six of Eight Hemoglobin A1c Pointof-Care Instruments Do Not Meet the General Accepted Analytical Performance Criteria. Clin Chem 2010;56:44-52.

# Accuracy results - Comparison with avg of 3 reference methods

![](_page_21_Figure_1.jpeg)

22

# What do the statistics tell us about the size of errors?

Lot #1 y = 0.97x + 0.12, R = 0.98, bias -0.09

- - Lot #2 y = 1.03x - 0.00, R = 0.99, bias +0.27

# For Xc=7.0 %Hb Yc = 0.97\*7.0 + 0.12 = 6.91 SE = 6.91-7.0 = -0.09 %Hb or 1.3%Bias Yc = 1.03\*7.0 - 0.0 = 7.21 SE = 7.21 - 7.0 = +0.21 %Hb or 3.0%Bias

What quality is needed in a medical laboratory for the intended clinical use of HbA1c? CAP criterion was 10% in 2009, 8% in 2010 (8%) and will be 6% in 2011 ■ NGSP 2010 criterion of ±0.75 %Hb corresponds to TEa of 10.7% @ 7.0 %Hb; CLIA criterion for acceptable performance of glucose is 10%

#### What's sigma?

Estimate precision midrange as average of observed CVs at 5.1 and 11 %Hb  $-CV = \sim (1.8+3.7)/2 = \sim 2.75\%$ Calculate sigma for each lot # Sigma = (%TEa-%Bias)/(%CV) □ Sigma = (10%-1.3%)/2.75% = 3.16  $\Box$  Sigma = (10% - 3.0%)/2.75% = 2.55

#### Houston – We have a problem! Or maybe not???

Waived test doesn't have to meet US CLIA minimum QC of 2/day, nor EQC of 2/week or 2/month! Just follow manufacturer's instructions and recommendations Not required to validate method performance! Not required to participate in PT!

#### What's the point?

Ist issue is whether the device can achieve the necessary quality when it is working correctly?

Method validation is critical, but not required!

Quality is controlled by FDA when device is approved as "waived"

2<sup>nd</sup> issue is that QC only monitors the stable performance achieved

Of little use if device can't achieve desired performance

#### What's the plan for AQM?

![](_page_27_Figure_1.jpeg)

#### ISO 15189 Assuring the quality of examination procedures

Performance specifications for each procedure used in an examination shall relate to the intended uses of that procedure.

The laboratory shall design internal quality control systems that verify the attainment of the intended quality of results.

#### Where find Guidance to design QC? CLSI C24-A3 (2006)

3<sup>rd</sup> edition published in June 2006 Updates QC planning process Adds "Sigma-metric QC selection" tool Define quality requirement as allowable total error (TEa) Calculate sigma as (TEa – bias)/SD Where bias represents inaccuracy of method SD represents imprecision of method

Relationship of Sigma to QC
 Critical Systematic Error (ΔSE<sub>crit</sub>)

 Index used to describe size of error that needs to be detected by QC procedure
 ΔSE<sub>crit</sub> = [(TEa - Bias)/CV] - 1.65

△SE<sub>crit</sub> + 1.65 = Sigma
 Can relate △SE to rejection characteristics of QC rules and numbers of QC measurements using known power curves

#### Sigma-metrics QC Selection Tool 2 Levels Control

![](_page_31_Figure_1.jpeg)

What's the point? QC needed for a test depends on sigma performance of method!

- 6 sigma process any common single rule QC will do!
- 5 sigma process single rule QC with 2.5s limits and N of 2-3
- 4-sigma process single rule QC with 2.5s limits or multirule QC with Ns of 3-6

3-sigma process – do all QC possible Ns of 6-8

Can't afford to run enough controls to detect medically important errors!

#### What QC is needed? 3 Levels Control (2.55 Sigma)

![](_page_33_Figure_1.jpeg)

#### What QC is needed? 3 Levels Control (3.16 Sigma)

![](_page_34_Figure_1.jpeg)

#### **Example Application**

#### Method Performance Characteristics and QC Design

| Test (Units)                       | Glycated Hemoglobin (%Hb)         |        |           |         |  |  |  |
|------------------------------------|-----------------------------------|--------|-----------|---------|--|--|--|
| Method (Analyzer)                  | DCA Vantage                       |        |           |         |  |  |  |

| Analytical QC Strategy             | Hope and pray nothing goes wrong! |        |           |         |  |  |  |

#### What's the plan for AQM?

![](_page_36_Figure_1.jpeg)

#### Risk Management Approach for Developing QC Plan

Recommended by ISO, adopted by manufacturers Accepted by CLSI & CMS for "Alternate QC" EP18 "Risk management techniques to identify and control laboratory error sources" EP22 "Presentation of manufacturer's risk information" EP23 "User Quality Control Plans based on risk management"

#### **Risk Analysis**

 Manufacturer's expected to perform "Failure mode effects analysis" FMEA on all new products during design and before release

 FMEA is a standard risk management tool that has been widely used in industry
 Process much like quality improvement project and uses many of the same tools

#### **FMEA Applications**

Map process

- Identify potential sources of error (failure modes)
- Estimate risk
- Prioritize risks

Implement improvements to reduce risks
Identify controls to monitor "residual risks"
Evaluate residual risks

#### **Patient Testing Process**

![](_page_40_Figure_1.jpeg)

#### **Analytic Testing Process**

![](_page_41_Figure_1.jpeg)

# Potential Failure Modes Incorrect or Delayed Test (CLSI EP18A3)

![](_page_42_Figure_1.jpeg)

#### Risk Mitigation Strategies for Analytic QC Plan

#### (1) Occurrence Calculate sigma-metrics

#### (2) Detection Prioritize control mechanisms Assess practicality/reliability Assemble list of controls Specify frequency

#### (3) Recovery/disclosure Specify corrective actions Specify safety information

(4) Analytic QC Plan Evaluate residual risk Document plan Implement controls

## Possible Control Mechanisms (CLSI EP23 QC Toolbox)

| Recommended QC Tool          | Control Objective    | Coverage              | Detection |
|------------------------------|----------------------|-----------------------|-----------|
| Analyst/operator controls    |                      |                       |           |
| Standard Operating Procedure | Process for safe use | Multiple runs         | Unknown   |
| Operator training            | Correct performance  | Total testing process | Unknown   |
| Operator checklists          | Proper operation     | Single runs           | Unknown   |
| System maintenance           | Proper operation     | Multiple runs         | Unknown   |
| Operator competency          | Correct performance  | Total testing process | Unknown   |
| Built-in analyzer controls   |                      |                       |           |
| Electronic checks            | Analyzer components  | Single runs           | Unknown   |
| Function tests               | Analyzer components  | Single runs           | Unknown   |
| Process tests                | Process steps        | Single samples        | Unknown   |
| Calibration checks           | Analyzer stability   | Single runs           | Unknown   |
| Integrated controls          | Analyzer stability   | Single runs           | Unknown   |
| Stable control materials     |                      |                       |           |
| Statistical QC               | Method stability     | Single runs           | Known     |
| SQC with peer comparison     | Method stability     | Multiple runs         | Knowable  |
| Periodic EQA, PT             | Method accuracy      | Multiple runs         | Knowable  |
| Trueness controls            | Method accuracy      | Multiple runs         | Knowable  |
| Patient data analysis        |                      |                       |           |
| Implausible values           | Random errors        | Single patients       | Unknown   |

| 16  | QC       | Interpret wrong      | Error  | 1.00 | Operator               | 1run/mon  | 0.0192 | Competency   | ?    | 1.00 | 0.0192 | 60     |
| 17  | Release  | Inconsistent results | Delay  | 0.50 | Analysis               | 5sam/day  | 0.0500 | Delta check  | ?    | 1.00 | 0.0250 | 78     |

**Risks of Risk Analysis** FMEA is a new tool and requires education and training for proper applications Most guidelines describe qualitative applications that use an "acceptability matrix" for evaluating residual risks Most guidelines neglect DETECTION Looks scientific, but is subjective with arbitrary decisions about acceptability of residual risks and effectiveness of QC Plan

#### What's the plan for AQM?

![](_page_50_Figure_1.jpeg)

#### How to: DEAL WITH AUTOMOTIVE DEFECTS

Modern cars are complex machines, and, as the renegade computer, HAL, taught us in 2001: A Space Odyssey, occasionally machines may try to kill us. Is another HAL loose at Toyota? Well, Toyota's not the first to have its feet put to the fire. Our flowchart chronicles the history of disastrous screw-ups and the resulting corporate responses. See if you can remember them. — TONY QUIROGA
