

Analytical variation in factor VIII one-stage and chromogenic assays

**Experiences from the ECAT external
quality assessment programme**

Iris van Moort, PhD student

Erasmus University Medical Center – Sophia Children's Hospital

ECAT participants meeting, 8 November 2018

(Mis)classification haemophilia A

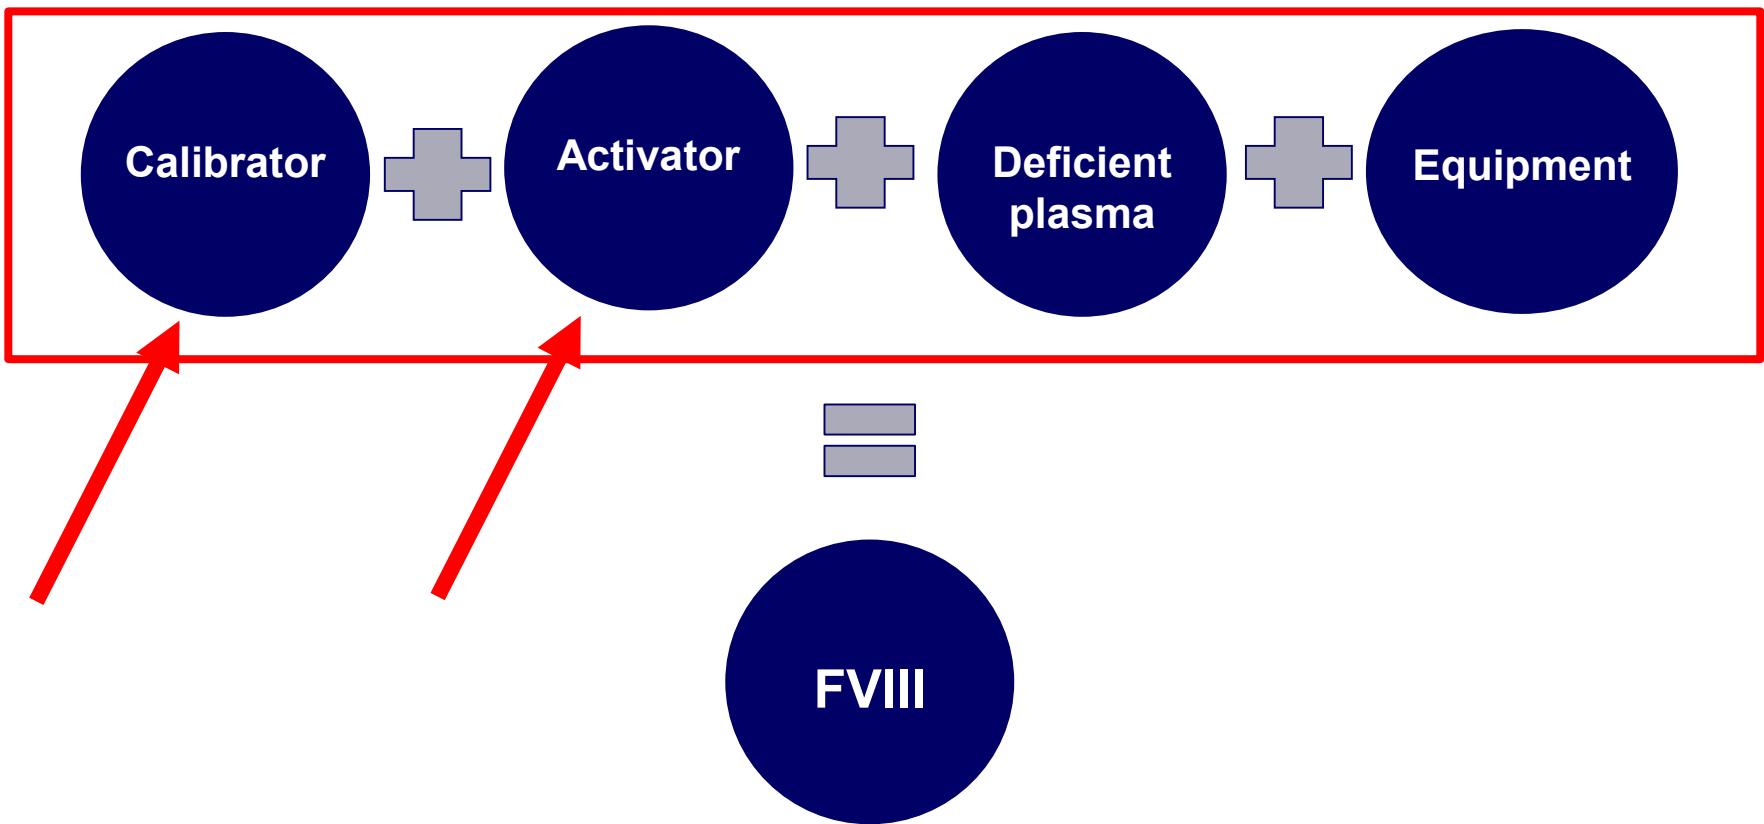

Aim

To investigate and quantify variation in FVIII activity

- 1) One-stage assay (OSA) and chromogenic substrate assay (CSA)
- 2) ECAT surveys

Test system

Test systems

SIEMENS

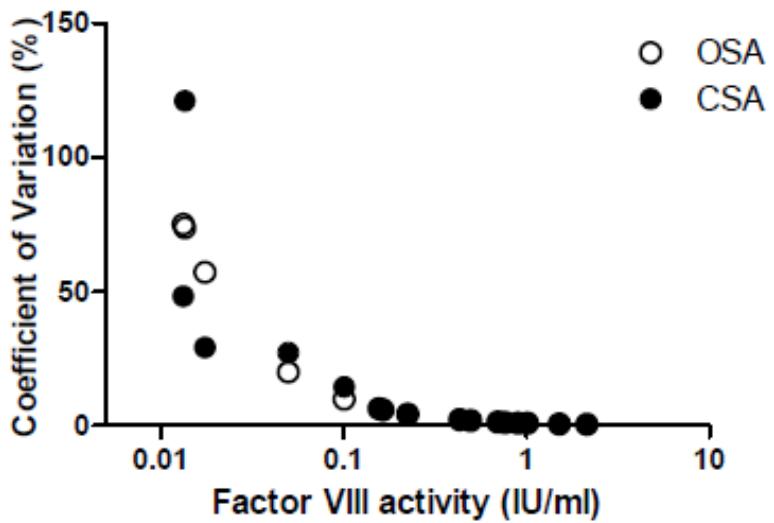

2010 - 2016

>10 laboratories

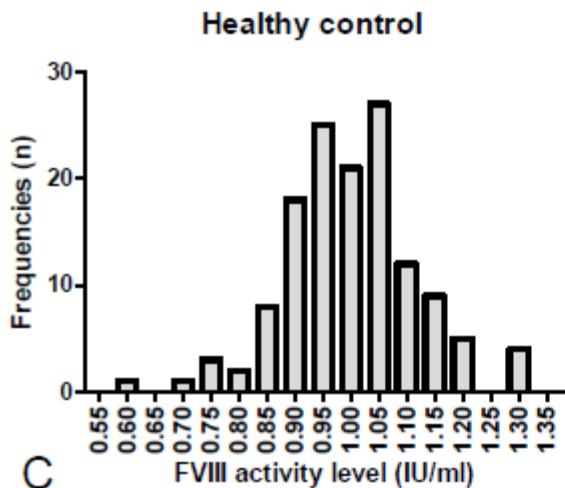

CV increases when FVIII decreases

A

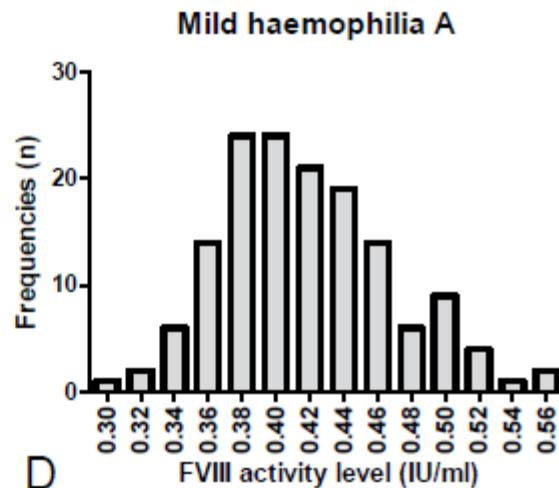

Variation in OSA results in misclassification (ECAT)

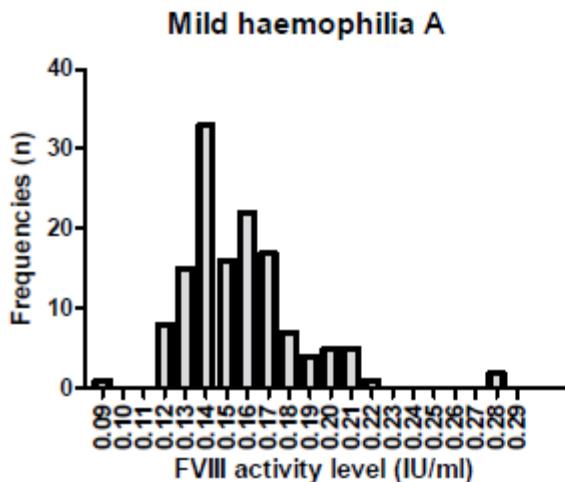

A

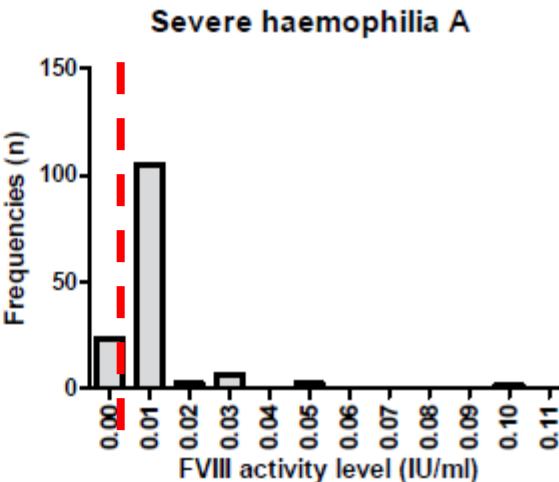

B

C

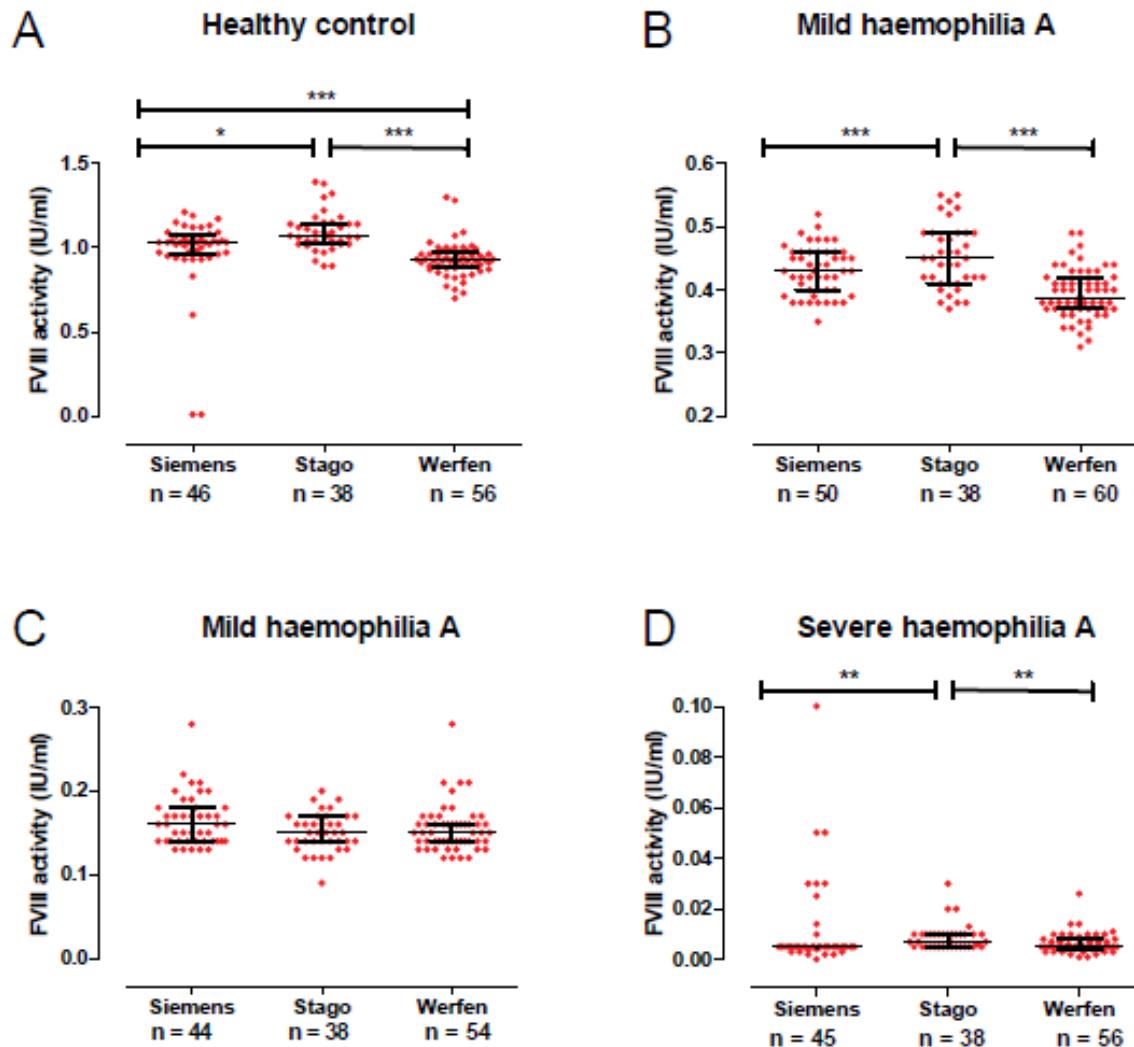

D

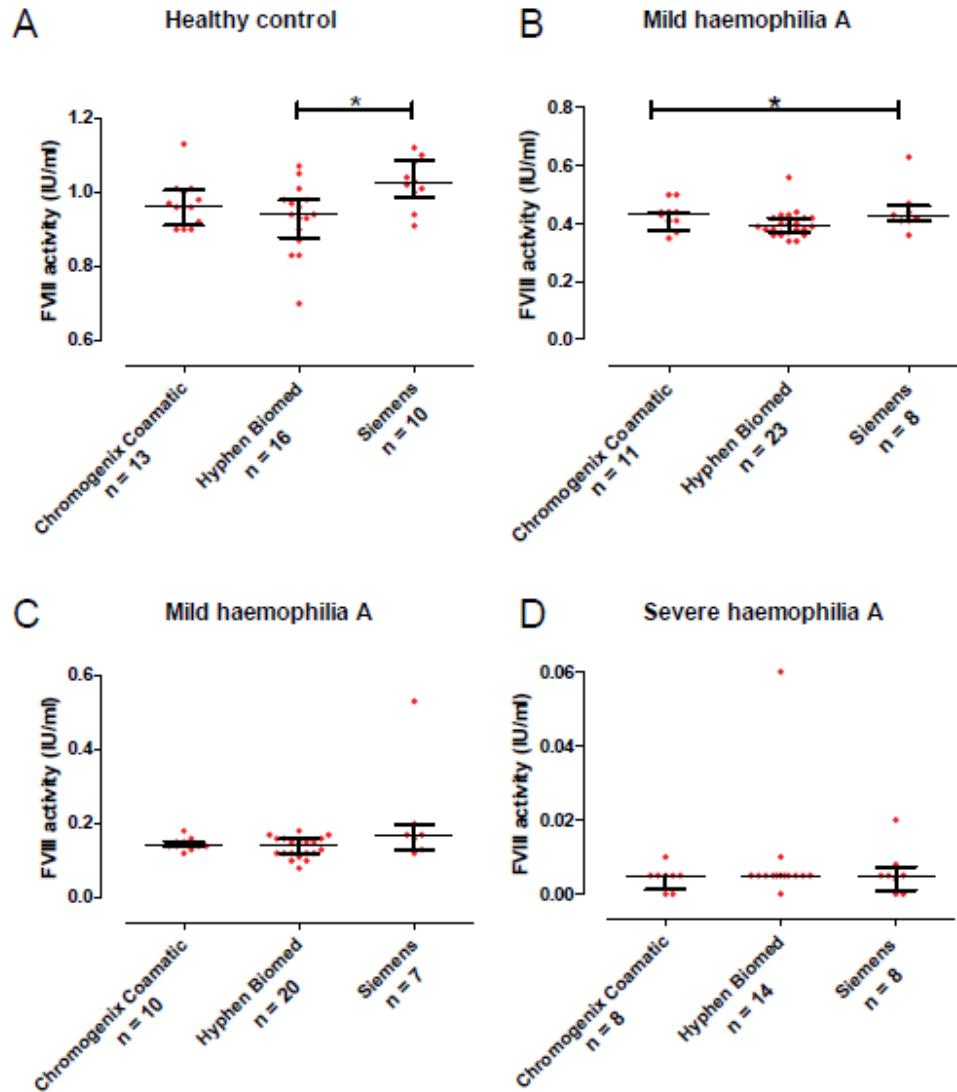

Misclassification

OSA 37/139 (26.6%)
CSA 4/30 (13.3%)

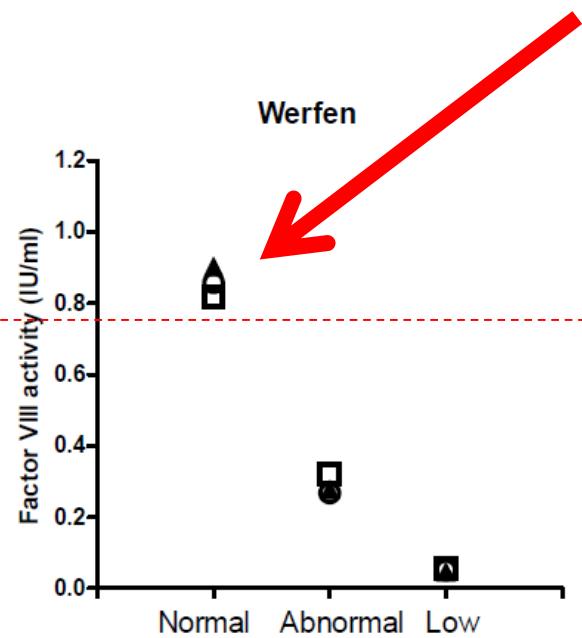

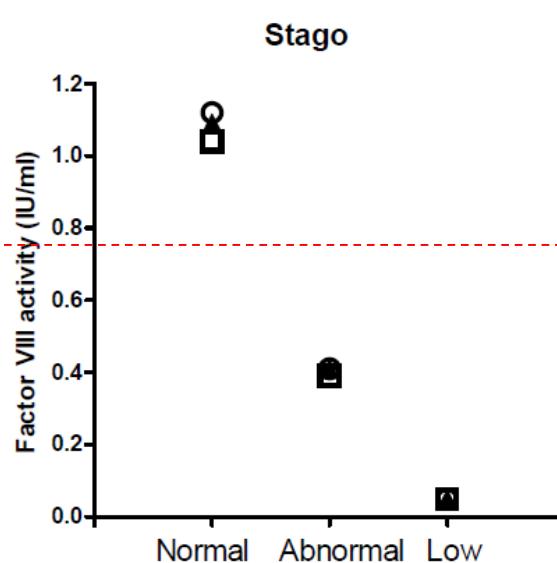

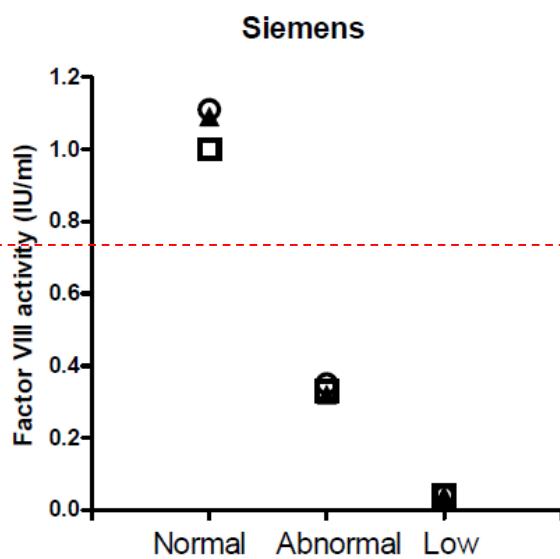

OSA – test systems companies

CSA – no consistent differences

Exchange deficient plasma in OSA

Deficient plasma

- Siemens
- Stago
- ▲ Werfen

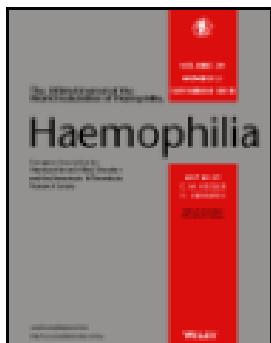

Calibrator

	Assigned calibration value (IU/ml)	Measured FVIII value (IU/ml)
STA-Unicalibrator	1.10	1.21
HemosIL calibrator	0.98	1.12

Underestimation in FVIII levels?

Conclusion

- FVIII activity levels are negatively associated with CV
- Variation results in misclassification in both CSA and OSA
- Variation in OSA
 - Company test systems
 - Calibrator
